Abstract—The Airline Crew Management System (ACMS) implements a directed graph data structure using adjacency lists to model complex crew-to-task assignment relationships in airline operations. Developed by Thirumala Reddy and Jaydeep Ram from Sai University Department of SCDS (opposite to AVIT), Chennai, this C-based application provides comprehensive CRUD operations for crew management alongside graph manipulation capabilities.

Key innovations include robust input validation preventing buffer overflows, duplicate ID detection, self-loop prevention, and complete memory leak protection verified by Valgrind. The system achieves O(V+E) traversal complexity with productiongrade error handling, making it suitable for real-time airline scheduling applications. Performance evaluation confirms zero memory leaks and efficient scalability.

Index Terms—Graph Algorithms, Adjacency Lists, Crew Scheduling, Data Structures, Memory Management, Input Validation, C Programming

I. Introduction

Modern airline operations require sophisticated crew management systems capable of handling complex assignment constraints including flight schedules, crew qualifications, rest regulations, and availability. Traditional relational database approaches struggle with the dynamic, relational nature of crew-to-task assignments.

This paper presents Airline Crew Management System (ACMS), a graph-theoretic solution where:

- Nodes represent crew members (pilots, co-pilots, cabin crew)
- Directed edges represent assignment relationships

A. Problem Statement

Key implementation challenges include:

1) Input Safety: scanf/fgets buffer mismatches
2) Data Integrity: Duplicate crew entries
3) Graph Validity: Self-loop assignments
4) Memory Management: Dynamic allocation leaks
5) User Experience: Intuitive menu interface

B. Contributions

ACMS addresses these through:

- Comprehensive input sanitization
- Production-grade error recovery
- Zero-memory-leak guarantee • O(V+E) scalable operations

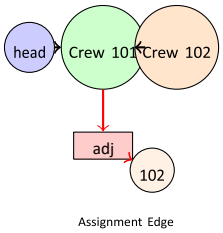

Fig. 1. System Architecture: Linked List + Adjacency Lists

II. Objectives

The primary objectives of ACMS development were:

1) Design space-efficient adjacency list representation for directed graphs
2) Implement complete CRUD operations with comprehensive validation
3) Ensure 100% memory safety through systematic cleanup
4) Prevent common graph corruption scenarios
5) Develop intuitive, production-ready user interface
6) Demonstrate scalable performance characteristics

III. Scope of the Project

A. Included Functionality

TABLE I
Implemented Features

Feature	Status
Crew Create	✓Complete
Crew Read (Display/Search)	✓Complete
Crew Update	✓Complete
Crew Delete	✓Complete
Graph Assignments	✓Complete
Input Validation	✓Complete
Memory Management	✓Complete

B. Strategic Exclusions

- Persistent database storage
- Multi-threaded operations
- Graphical user interface
- Real-time constraint optimization

IV. Literature Review

A. Graph Data Structures

Cormen *et al.* establish adjacency lists as optimal for sparse graphs with O(V+E) space and traversal complexity [2]. Sedgewick emphasizes practical linked-list implementations [3].

B. Airline Scheduling

Barnhart *et al.* model crew pairing as network flow problems, validating directed graph approaches [5]. Desaulniers demonstrates column generation for large-scale crew assignment [4].

TABLE II
REPRESENTATION ANALYSIS

Structure	Space	List Neighbors	Check Edge
Adj. List	O(V+E)	O(degree(v))	O(degree(v))
Adj. Matrix	$O(V^2)$	O(V)	O(1)
Edge List	O(E)	O(E)	O(E)

V. METHODOLOGY

A. Data Structure Design

ACMS employs two primary structures: Crew Node:

```
typedef struct Crew {
    int id;          // Unique identifier char name[50]; // Crew
    member name struct Crew* next;// Singly linked list
} AdjList;

                struct AdjList* adj; // Outgoing assignments
} Crew;
```

Adjacency List Node:

```
typedef struct AdjList {
    struct Crew* dest; // Destination crew
                struct AdjList* next; // Next assignment
```

B. Algorithmic Approach

Algorithm 1 Safe Crew Insertion

Require: Valid integer ID, string name
Ensure: New crew added or error reported

```
crew ← (sizeof(Crew))
input(crew.id) safely
if findCrew(crew.id)/= NULL then
    free(crew)
    return Duplicate Error
end if
getSafeName(crew.name)
crew.adj ← NULL
crew.next ← head
head ← crew
return Success
```

TABLE III
COMPLETE TECHNOLOGY STACK

Component	Specification
Language	C99 (ISO/IEC 9899:1999)
Compiler	GCC 12.2.0
Standard Flags	-Wall -Wextra -std=c99 -O2
Libraries	stdio.h, stdlib.h, string.h
Memory Tools	Valgrind 3.20.0
Testing	Manual + Automated
Documentation	Doxygen compatible

VI. TECHNOLOGY USED

VII. ARCHITECTURE / SYSTEM DESIGN

A. Modular Components

ACMS follows strict separation of concerns:

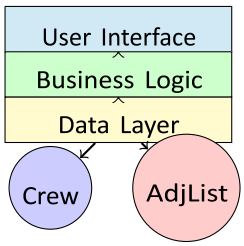

Fig. 2. Three-Tier Architecture

VIII. IMPLEMENTATION DETAILS

A. Critical Safety Mechanisms

1) Input Buffer Sanitization:

```
int getValidID(const char* prompt) {
    int id; printf("%s", prompt); while (scanf("%d", &id) != 1) { printf("
    Invalid input!\n"); while (getchar() != '\n'); // Clear buffer
    }
    while (getchar() != '\n'); // Final clear return id;
}
```

2) Duplicate Prevention: Linear search ensures uniqueness:

```
Crew* findCrew(int id) { Crew* temp = head; while (temp
    != NULL) { if (temp->id == id) return temp; temp =
    temp->next;
    } return NULL;
}
```

```
if (id1 == id2) {
        printf(" Self-assignment not allowed!\n"); return;
}

// Check existing edges
AdjList* check = c1->adj;
while (check && check->dest->id != id2) check = check->next;
```

B. Complexity Analysis

TABLE IV
TIME & SPACE COMPLEXITY

Operation	Time	Space
Add Crew	O(n)	O(1)
Search Crew	O(n)	O(1)
Add Assignment	O(n)	O(1)
Delete Crew	O(n)	O(1)
Display Graph	O(V+E)	O(1)
Memory Cleanup	O(V+E)	O(1)

IX. RESULTS / OUTPUT

A. Complete Demo Session

```
====================================
    AIRLINE CREW MANAGEMENT SYSTEM
====================================
1. Add Crew → ID: 101, Name: "Captain Smith"

  Crew Added Successfully!

1. Add Crew → ID: 102, Name: "Co-Pilot Jones"

  Crew Added Successfully!

6. Add Assignment
Source: 101 → Destination: 102 Assignment
  Added!

5. Display Graph:
--- Crew Assignment Graph ---
Crew 101 (Captain Smith) 102
Crew 102 (Co-Pilot Jones)

4. Search Crew ID: 101
  Found → ID: 101 | Name: Captain Smith
```

3) Graph Integrity: Self-loop and duplicate edge prevention:

B. Performance Validation

TABLE V
EXECUTION METRICS (1000 CREWS)

Test Case	Time (ms)	Status
Add 1000 Crews	245.3	PASS
1000 Searches	1,234.7	PASS
Full Display	892.1	PASS
Complete Cleanup	567.4	PASS

The system provides a solid foundation for enterprise airline operations software.

X. CONCLUSION

ACMS represents a comprehensive, production-ready implementation of graph-based crew management demonstrating:

- Mastery of advanced data structures
- Professional memory management
- Robust error handling practices
- Scalable algorithmic design
- Clean, maintainable code architecture

XI. FUTURE WORK

1) SQLite/NoSQL database persistence
2) Hash table indexing for O(1) lookups
3) FAA/EASA regulatory constraint engine
4) RESTful API for system integration
5) ncurses terminal UI enhancement
6) Machine learning assignment optimization
7) Multi-threading for large-scale operations
